P90 Silverline Pallet Racking

The next generation of pallet storage

The next generation of adjustable
pallet racking.

Adjustable pallet racking was a Dexion invention

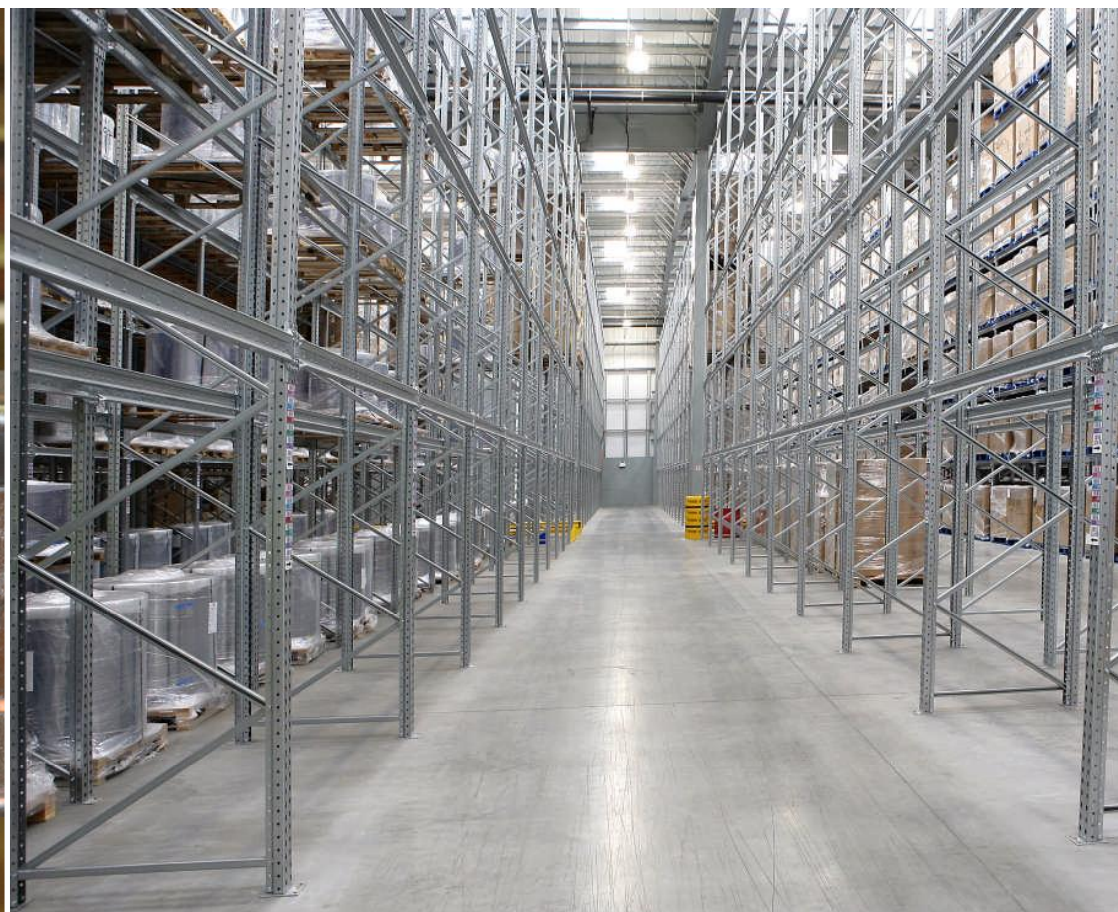

For over 60 years Dexion has been setting standards in adjustable pallet racking when it designed the first perforated steel profiles for storage. We continue to develop products with our customers needs in mind, manufacturing and supplying products right across Europe.

Dexion P90 Silverline Pallet Racking is the next generation of pallet storage for either static or dynamic systems. A new efficient beam profile and unique connection design allows for a more environmentally friendly method of production, reducing material content while still providing exceptional rigidity and strength.

Dexion is the specialist in customised, efficient warehouse storage solutions. Based on our many years of experience in storage technology and constantly exchanging information with our customers, we make continuous improvements in our products - technically, qualitatively and conceptually.

Dexion maintains a network of marketing and distribution offices throughout Europe and a national network of approved distributors across the UK - which means we are never far from our customers, allowing us to respond rapidly to local demands and meet our customers needs.

Our aim is to work with you, developing a customised, storage solution that corresponds exactly to your storage requirements. Using the Dexion P90 pallet racking system, along with its comprehensive range of accessories, means that this system is flexible to your demands. Dexion P90 pallet racking is the ideal system for both your static and dynamic pallet storage needs.

P90 Silverline is tomorrow's pallet racking system today

The Dexion P90 Silverline pallet racking system takes a whole new and innovative approach to pallet racking design. The new 'I' beam profile offers environmentally friendly production, enhanced label visibility and increased warehouse safety while still delivering the same high quality, outstanding performance and efficiency the world has come to expect from all Dexion Products.

P90 Silverline pallet racking has versatility, strength and dependability built-in, it is designed to fulfil the stringent requirements of all European standards as well as conforming to UK SEMA codes of practice for pallet racking.

Optimum Adaptation

Regardless of the kind of pallets you are using, euro-pallets, disposable pallets, wooden or plastic, mesh box-pallets or containers - P90 Silverline will always be able to match the required formats in width, depth and height. The physical space of your warehouse will also be used in the most optimal way with an availability of heights from 1.5m and up to 30m. Heights up to 15m can be accommodated in single piece uprights.

Profiled Beams

The P90 Silverline "I" Profile beams provide a variety of benefits to end users.

The many angled face provides excellent visibility of labels at height or low level, with labels angled towards the operator.

Originally developed for the automotive industry, the Silverline beam utilises a state of the art 'Tox' connection system. This utilises a punch and die combination to join the beam section and end

connector together, creating a strong and robust joint from the metal of the components, creating a joint as strong as any welded seam, without the associated environmental issues.

Increased Safety

The profile of the Silverline beam and the design of its connectors allows for narrower frame depths than conventional pallet racking. This leads to an increased aisle width between uprights and thus a reduced susceptibility to damage by forklift trucks.

Forklift truck drivers are encouraged to position pallets away from the uprights as required in codes of practice by the shoulders at the beam connectors, thus improving the safety of pallet storage.

Locking pins are an important safety feature of any pallet racking structure, ensuring that the connectors are correctly located. The presence of a P90 locking pin is easily identified by its red colour, providing an instantly recognisable assurance when present.

Future Proofed

The pre-galvanised steel provides a much improved and very durable finish for the long term over painted products. When scratched the finish protects itself by healing and preventing corrosion. Dexion led the market several years ago with pre-galvanised uprights and we are now doing the same with the beams.

P90 Silverline features

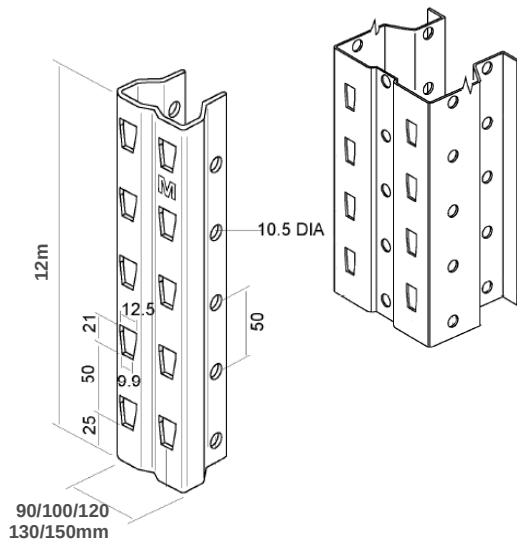

- Unique environmentally friendly construction method
- Improved surface finish providing long term durability
- Enhanced structural design of beam Profile
reduces material required
- Ease of pallet location away from uprights
- Reduced risk of damage due to wider aisles
- Improved location label visibility with profile of beam

Dexion P90 Silverline Pallet Racking

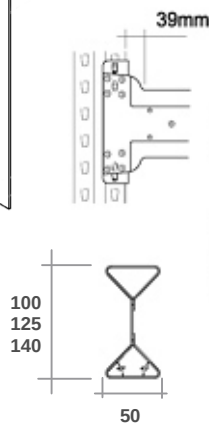

P90 frame uprights

Pre galvanised uprights are available as single piece uprights in 21 different profiles, three widths and in lengths from 1.5m to 15m, suitable for use up to 30m high.

Silverline beams

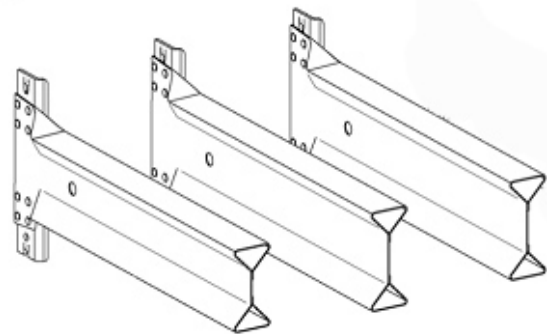

"I" Profiled beams are available in three section sizes 100, 125 & 140mm and seven standard lengths from 1150mm up to 3600mm.

P90 Beams and accessories

Pre-galvanised or painted P90 standard box and open section beams are also available in similar lengths and strengths.

The usual accessories are all available for use with the "I" profiled Silverline beams.
